1 Overview

1.1 How to use this component operating manual

Fig. 1-1 Structure of the IQ SENSOR NET operating manual

The IQ SENSOR NET operating manual has a modular structure like the IQ SENSOR NET system itself. It consists of a system operating manual and the operating manuals of all the components used.

Please file this component operating manual into the ring binder of the system operating manual.
1.2 Structure of the TriOxmatic® 702 IQ D.O. sensor

1.3 Recommended fields of application

Stationary measurements in boiler feed water and trace measurements in water. The measurement is a flow-thru measurement, e.g. uses the D702/N flow-thru vessel (available as an accessory).
2 Safety

This component operating manual contains special instructions that must be followed during the operation of the TriOxmatic® 702 IQ D.O. sensor. Thus, it is essential to read this component operating manual before carrying out any work using this sensor. In addition to this manual, the SAFETY chapter of the IQ SENSOR NET system operating manual must be followed.

Always keep this component operating manual together with the system operating manual and any other component operating manuals in the vicinity of the IQ SENSOR NET system.

Special user qualifications

The D.O. sensor was developed for applications using the online measurement technique. Thus, we assume that the operators are familiar with the necessary precautions to take when dealing with chemicals as a result of their professional training and experience.

General safety instructions

Safety instructions in this operating manual can be recognized by the warning symbol (triangle) in the left column. The signal word (e. g. "Caution") indicates the level of the danger:

Warning
indicates instructions that must be followed precisely in order to prevent serious dangers to persons.

Caution
indicates instructions that must be followed precisely in order to avoid slight injuries or damage to the instrument or the environment.

Other labels

Note
indicates notes that draw your attention to special features.

Note
indicates cross-references to other documents, e.g. operating manuals.
2.1 Authorized use

The authorized use of the TriOxmatic® 702 IQ comprises its use as a D.O. sensor in the IQ SENSOR NET. The technical specifications according to chapter 7 TECHNICAL DATA must be observed. Only operation according to the instructions in this operating manual is authorized.

Any other use is considered to be unauthorized. Unauthorized use invalidates any claims with regard to the guarantee.

Caution
Only connect and operate the sensor together with IQ SENSOR NET accessories.

2.2 General safety instructions

The sensor left the factory in a safe and secure technical condition.

Function and operational safety

The failure-free function and operational safety of the sensor is only guaranteed if the generally applicable safety measures and the special safety instructions in this operating manual are followed during its use.

The failure-free function and operational safety of the sensor is only guaranteed under the environmental conditions that are specified in chapter 7 TECHNICAL DATA.

The specified temperature (chapter 7 TECHNICAL DATA) must be maintained during the operation and transport of the sensor. Protect the sensor, particularly against frost or overheating.

Caution
The sensor may only be opened by specialists authorized by YSI. The only exceptions to this are the activities described in chapter 5 MAINTENANCE, CLEANING, DISPOSAL, AND REPLACEMENT.
**Safe operation**

If safe operation is no longer possible, the sensor must be taken out of operation and secured against inadvertent operation.

Safe operation is no longer possible if the sensor:
- has been damaged in transport
- has been stored under adverse conditions for a lengthy period of time
- is visibly damaged
- no longer operates as described in this manual.

If you are in any doubt, contact the supplier of your sensor.

**Obligations of the operator**

The operator of the sensor must ensure that the following rules and regulations are followed when dealing with hazardous substances:
- EEC directives for protective labor legislation
- National protective labor legislation
- Safety regulations
- Safety data sheets of the chemical manufacturer.
3 Commissioning

3.1 Scope of delivery

- TriOxmatic® 702 IQ
- ZBK 25i accessory case
- RA 600 cleaning attachment
- The sensor is filled with electrolyte and provided with a protective hood.
- Operating manual.

3.2 Installation

**Connection cable**

The SACIQ sensor connection cable is required to connect the sensor. Information on this and other IQ SENSOR NET accessories is given in the YSI catalog and on the Internet.

**Note**

How to connect the SACIQ sensor connection cable to the terminal strip of an MIQ module is described in chapter 3 INSTALLATION of the IQ SENSOR NET system operating manual.

**Are the plug connections dry?**

Before connecting the sensor and sensor connection cable, please make sure the plug connections are dry. If moisture gets into the plug connections, first dry the plug connections (dab them dry or blow them dry using compressed air).

**Note**

Do not suspend the sensor on the sensor connection cable. Use an armature or flow-thru vessel. We recommend to perform the measurement and installation in the D 702/N flow-thru vessel using the ADA-DF 4 and ADA-DF 6 adapters. Information on this and on other IQ SENSOR NET accessories is given in the YSI catalog and on the Internet.

**Minimum approach flow**

The minimum required approach flow at the sensor must be present during measurement (see chapter 7 TECHNICAL DATA). The minimum approach flow can, e.g. be achieved by:

- the flow rate of the water
- the correct flow-thru in the flow-thru vessel.
### Connecting the sensor to the sensor connection cable

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Take the protective caps off the plug connections of the sensor and the SACIQ sensor connection cable and keep them safe.</td>
</tr>
<tr>
<td>2</td>
<td>Plug the jack of the SACIQ sensor connection cable onto the plug head connector of the sensor. At the same time, rotate the socket so that the pin in the plug head connector (1) clicks into one of the two holes in the jack.</td>
</tr>
<tr>
<td>3</td>
<td>Then, screw the coupling ring (2) of the sensor connection cable onto the sensor up to the stop.</td>
</tr>
</tbody>
</table>

**Fig. 3-1 Connecting the sensor**

3.3 Commissioning / Getting the instrument ready for measuring

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Pull the protective cap off the sensor.</td>
</tr>
<tr>
<td>2</td>
<td>Leave the sensor to lie in the air for at least 60 minutes while it is switched on (polarization).</td>
</tr>
</tbody>
</table>

**Note**

For the sensor to polarize, the following conditions must be fulfilled:

- The sensor is connected with the IQ SENSOR NET system via the SACIQ sensor connection cable.
- The IQ SENSOR NET system is in operation
- The sensor has been identified by the IQ SENSOR NET system.

**Precision measurements**

Recommendation: In order to carry out precision measurements, leave the sensor to polarize for a longer period of time, e.g. overnight, and recalibrate it the following day.

</tr>
<tr>
<td></td>
<td>• last valid</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• active</td>
<td>valid indicates that a valid calibration is available. The value cannot be changed.</td>
</tr>
<tr>
<td></td>
<td>• abort</td>
<td>invalid is displayed if the last calibration is invalid and the sensor is blocked for measurement. In this case, you can switch to the values of the last valid calibration, provided a valid calibration is available in the sensor. Thus you activate the last valid calibration stored in the sensor the next time you exit the setting table with Save and quit. The next time the setting table is opened, valid is displayed.</td>
</tr>
<tr>
<td>Temperature mode</td>
<td>• °C</td>
<td>Unit of the measured temperature value (Celsius, Fahrenheit).</td>
</tr>
<tr>
<td></td>
<td>• °F</td>
<td></td>
</tr>
</tbody>
</table>
### Temp. adjustment

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-1.5 K ... +1.5 K</td>
<td>The temperature compensation enables the tolerances of the temperature sensor to be balanced (shifting of the zero point by ±1.5 K).</td>
</tr>
</tbody>
</table>

**Notes:**
- Due to the thermal capacity of the sensor, it is necessary to place it in a container with at least 2 liters of water.
- Leave the sensor in this container for at least 15 minutes while stirring occasionally until the balancing can be performed. With temperature differences between the water and sensor > 10 °C, leave the sensor for at least 1 hour in this container while stirring occasionally until the balancing can be performed.

### Save and quit

- The system confirms the saving of the settings and the display switches to the next higher level.

### Quit

- The display switches to the next higher level without saving the new settings.

### Carrying out settings

Using 

Carrying out settings

Using 5, switch from the measured value display to the main menu of the settings. Then navigate to the setting menu (setting table) of the sensor. The exact procedure is given in the relevant IQ SENSOR NET system operating manual.
4 Measuring / Operation

4.1 Measuring

1. Install the sensor in the D 702/N flow-thru vessel (see operating manual of the flow-thru vessel) and put it into operation with the measuring medium.

2. Read the measured value on the terminal of the IQ SENSOR NET system.

4.2 Calibration

4.2.1 General information on calibration

Why calibrate? During the operation of a D.O. sensor, the slope of the D.O. sensor changes with time. The calibration procedure determines the current slope of the sensor.

When to calibrate? Calibrate before measuring and at regular intervals (depending on the application).

Calibration procedures Ideally, calibration takes place in water vapor-saturated air. To do so, position the sensor approx. 2 cm above a water surface, for example in a narrow bucket or similar container with water. In the case of air temperatures under 5 °C we recommend to calibrate not in air but in air-saturated water that has a higher temperature. You obtain air-saturated water by pouring water several times in and out of two vessels so that it sparkles.

Calibration log The calibration history contains the calibration log of the current and the last calibration. You can call up the calibration reports for the sensor via the Calibration history display option.

Note For calibration the membrane always has to be clean, for calibration in air it has to be dry. Clean contaminated sensors before calibration (see section 5.2 Cleaning the Sensor Shaft and Membrane).

Maintenance condition During calibration the sensor is in the so-called maintenance condition. This means all linked outputs retain their momentary state. After finishing calibration the maintenance condition has to be switched off manually. For more detailed information on the maintenance condition please refer to the respective IQ SENSOR NET system operating manual.
Generally, calibration on the IQ SENSOR NET is carried out as follows. System specific details are given in the respective IQ SENSOR NET system operating manual.

### 4.2.2 Calibration in water vapor-saturated air

1. If necessary, clean the sensor and membrane and dry the membrane (see section 5.2 CLEANING THE SENSOR SHAFT AND MEMBRANE).

2. Start calibration and follow the instruction on the display until the instruction *Bring sensor into calibrating position* appears.

### Calibrating position

![Calibrating position diagram](image-url)
3 Bring the sensor into the calibrating position.
   To do so, position the sensor approx. 2 cm above a water
   surface, best in a narrow bucket or similar container with water.
   When doing so, no liquid should be brought on the membrane.

Note
Up to this point, you can break off the calibration procedure at any time
with the key. The system continues to work with the old calibration
data. However, you have to switch off the maintenance condition in any
case.
After starting the calibration with the key (step 4), you cannot break
off the calibration any more.

4 Continue with .
   The calibration data is automatically determined and
documented in the calibration record.

5 Complete the calibration procedure according to the
   instructions on the display.

Note
In the case of air temperatures under 5 °C do not calibrate the sensor
in air but in air-saturated water that has a higher temperature. You
obtain air-saturated water by pouring water several times in and out of
two vessels so that it sparkles. Then immerse the sensor in a vessel
with air-saturated water and calibrate as described above.

Possible results of the calibration
The calibration data are evaluated by the system. A calibration can
have the following results:

<table>
<thead>
<tr>
<th>Display after the calibration</th>
<th>Log book entries (meaning/actions)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Measured value display</td>
<td>Sensor was successfully calibrated. For the calibration data, see the calibration history.</td>
</tr>
<tr>
<td>&quot;----&quot;</td>
<td>Sensor could not be calibrated. Sensor blocked for measurement.</td>
</tr>
<tr>
<td></td>
<td>– Service the sensor immediately (see operating manual).</td>
</tr>
<tr>
<td></td>
<td>– View calibration history.</td>
</tr>
<tr>
<td></td>
<td>– Check calibration conditions and calibration standard.</td>
</tr>
</tbody>
</table>
4.2.3 Calibration history

The calibration history contains the following information:

- Date of the calibration
- Relative Slope (dimensionless)
- Rating of the calibration:
  - o.k.: Calibration was successful. The new calibration values are used for the measurements.
  - Error: Calibration was not successful. The Sensor is blocked for measurement.

4.2.4 Reactivation of the last valid calibration

The TriOxmatic® 702 IQ enables you to reactivate the last valid calibration when needed. Thereby, it is possible to continue with measurements, when a calibration failed or it is assumed that optimal calibration conditions were not met.

Note

The reactivation of former calibration data is only a temporary solution. Please consider, that thereby possibly wrong measurement values are produced. Please check correct functioning of the sensor by performing a function check and/or a user calibration.

Reactivating the last valid calibration data

1. Open the the setting table (see section 3.4).
2. Choose in the menu item Calibration the setting last valid and quit the setting table afterwards with Save and quit.
4.3 Function check

The function check is the simplest way of letting you know whether the sensor needs to be cleaned and calibrated.

**Note**
The function check can either be performed in water vapor-saturated air or in air-saturated water. In the case of air temperatures under 5 °C we recommend to perform the function check not in air but in air-saturated water that has a higher temperature.

**Note**
The function check is carried out in the measuring mode, % saturation. When switching to the measuring mode % saturation, information on linked outputs is lost.

**Function check in water vapor-saturated air**

Proceed as follows:

1. Take the sensor out of the flow-thru vessel and position it approx. 2 cm above a water surface, best in a narrow bucket or similar container with water. When doing so, no liquid should be brought on the membrane.

2. Wait at least 15 minutes for the temperature to adapt.

3. In the sensor setting table, select the measuring mode % (unit %) and switch to the measured value display with.

4. Read the measured value and determine whether it lies within the range of precision required by the user.

**Note:**
If there are large temperature differences between the sample and the air above the surface of the water, a balancing period of more than 15 minutes may be required.
| **Measured values within the required precision** | If the measured value lies within the range of precision required by the user, no cleaning or recalibration is necessary.  
Example:  
Required precision 5 %.  
Measured value in air: 97 % saturation (nominal value: 100%)  
⇒ No cleaning or recalibration is necessary as the measurement error lies within the range of precision required by the user. |
| **Function check in air-saturated water** | In the case of air temperatures under 5 °C do not perform the function check in air but in air-saturated water that has a higher temperature. You obtain air-saturated water by pouring water several times in and out of two vessels so that it sparkles. Then submerge the sensor in a vessel with air-saturated water and perform the function check as described above. |
5 Maintenance, cleaning, disposal, and replacement

5.1 General maintenance instructions

Warning
Contact with the sample can lead to danger to the user!
Depending on the type of sample, suitable protective measures must be taken (protective clothing, protective goggles, etc.).

Maintenance condition
We recommend to switch on the maintenance condition each time before removing the sensor from its measuring position. This avoids unintended reactions of linked outputs. For more detailed information on the maintenance condition please refer to the respective IQ SENSOR NET system operating manual.

When to unscrew the sensor from the connection cable?
To clean the outside of the sensor (section 5.2) and to replace the electrolyte solution and membrane head (section 5.3), we recommend to leave the sensor connected to the sensor connection cable. Otherwise, moisture and/or dirt can get into the plug connection where they can cause contact problems. If you wish to disconnect the sensor from the sensor connection cable, note the points described below.

For the cleaning of the electrodes (section 5.4) the sensor must be unscrewed from the sensor connection cable to prevent any damage. Observe the following points for this:

- Unscrew the sensor from the SACIQ sensor connection cable.
- Always place a protective cap on the sensor plug head connector and on the SACIQ sensor connection cable so that no moisture or dirt can get into the contacting surfaces.
- In corrosive environments close the dry socket of the sensor connection cable with the SACIQ-Plug protective screw cap in order to protect the electrical contacts from corrosion. The protective cap is available as an accessory (see section 5.8 MAINTENANCE EQUIPMENT AND REPLACEMENT PARTS).
- Connect the sensor with the SACIQ sensor connection cable again before polarization.
5.2 Cleaning the sensor shaft and membrane

For normal operation (e.g. boiler feed water), cleaning and calibration are strongly recommended:

- if the measured values are suspected of being incorrect (usually too low)
- if the measured value lies outside the range of precision required by the user during the function check.

<table>
<thead>
<tr>
<th>Cleaning agents</th>
<th>Contamination</th>
<th>Cleaning agents</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>For loosely adhering dirt or biological deposits</td>
<td>Soft cloth or soft sponge, warm tap water with detergent</td>
</tr>
<tr>
<td></td>
<td>Salt and / or lime deposits</td>
<td>Acetic acid (volume percentage = 20 %), soft cloth or soft sponge</td>
</tr>
</tbody>
</table>

1. Take the sensor out of the flow-thru vessel and put it into a holding device.

2. Carefully clean the sensor shaft and the membrane as specified in the CLEANING AGENTS section.

3. Then, rinse it thoroughly with tap water.

Caution
Acetic acid irritates the eyes and the skin. When handling acetic acid, always wear protective gloves and protective goggles.

Caution
Clean the membrane very carefully! Make sure that the membrane is not damaged, e.g. by sharp-edged objects.
### 5.3 Changing the electrolyte and membrane cap

YSI delivers the sensor ready for operation. The electrolyte solution and membrane head must only be replaced:

- the electrolyte solution is depleted or the counter electrode is poisoned (log book message)
- after the gold working electrode and the silver counter electrode have been cleaned

**Note**

Information on the contents and structure of the log book, and how to call it up, is given in the LOG BOOK chapter of the IQ SENSOR NET system operating manual.

**Note**

Only unscrew the membrane head for maintenance purposes. After doing so, always use a new membrane head!

---

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>4</td>
<td>If necessary, carefully dry the membrane with a lint-free paper towel.</td>
</tr>
<tr>
<td>5</td>
<td>Also clean the flow-thru vessel.</td>
</tr>
<tr>
<td>6</td>
<td>Recalibrate the sensor (see section 4.2 CALIBRATION).</td>
</tr>
<tr>
<td>7</td>
<td>Install the sensor again in the flow-thru vessel.</td>
</tr>
</tbody>
</table>
Changing the electrolyte and membrane cap

1. Take the sensor out of the flow-thru vessel.

Caution
The ELY/A electrolyte solution irritates eyes, skin and mucus membranes. If it comes into contact with the eyes, rinse thoroughly with water and consult a doctor! During working activities, always wear suitable protective gloves and protective goggles/face shield! Follow the safety datasheet.

2. Unscrew the membrane head (for disposal of the membrane head and electrolyte solution, see section 5.7).

3. Rinse the sensor head with tap water.
4 Carefully rub the silver counter electrode with a paper towel and rinse it with deionized water.

5 Thoroughly rinse the sensor head with electrolyte solution.

6 Fill a new WP 25i membrane cap with ELY/A electrolyte solution (see section 5.8 MAINTENANCE EQUIPMENT AND REPLACEMENT PARTS).
7. Throw away the first filling and fill the membrane head once more with electrolyte solution.

8. Remove any air bubbles by carefully tapping the membrane head.

Caution
The ELY/A electrolyte solution irritates eyes, skin and mucus membranes. If it comes into contact with the eyes, rinse thoroughly with water and consult a doctor! During working activities, always wear suitable protective gloves and protective goggles/face shield! Follow the safety datasheet.

9. Screw the membrane head onto the shaft while holding the sensor at an angle. Excess electrolyte solution is forced out of the ventilation area.
5.4 Cleaning the electrodes

The counter electrode and reference electrode always exhibit a distinct coloration. This is necessary for the operation of the sensor. This is not contamination. Cleaning is only required in cases of slopes that are too small or too large (the sensor cannot then be calibrated) that cannot be resolved by changing the membrane head and the electrolyte solution.

Caution
To clean the electrodes, always unscrew the sensor from the SACIQ sensor connection cable. Otherwise, undesirable electrochemical reactions can occur that may lead to the destruction of the sensor.

Preparatory activities

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Take the sensor out of the flow-thru vessel.</td>
</tr>
<tr>
<td>2</td>
<td>Unscrew the sensor from the SACIQ sensor connection cable (see section 5.1 GENERAL MAINTENANCE INSTRUCTIONS).</td>
</tr>
</tbody>
</table>
Caution
The ELY/A electrolyte solution irritates eyes, skin and mucus membranes. If it comes into contact with the eyes, rinse thoroughly with water and consult a doctor! During working activities, always wear suitable protective gloves and protective goggles/face shield! Follow the safety datasheet.

3 Unscrew the membrane head (for disposal of the membrane head and electrolyte solution, see section 5.7).

4 Rinse the sensor head with tap water.
5.4.1 Cleaning the gold working electrode

1. Moisten the gold working electrode and the SF 300 polishing strip (see section 5.8 MAINTENANCE EQUIPMENT AND REPLACEMENT PARTS) with deionized water.

2. Using the rough side of the wet SF 300 polishing strip, polish off any contamination from the gold working electrode using light pressure.

Caution
Do not use any conventional sandpaper or glass-fiber brushes. They could damage the electrode.

3. Rinse the sensor head with deionized water.

Note
Cleaning the gold working electrode may already be sufficient to enable the sensor to be calibrated again. For safety, however, we recommend to also clean the silver counter electrode (see section 5.4.2) and to use a new membrane cap afterwards.
5.4.2 Cleaning the silver counter electrode

**Caution**
The reference electrode must not come into contact with the cleaning solution under any circumstances. This could destroy the reference electrode and cause the sensor to become defective. However, no danger can arise if the RA 600 cleaning attachment is used correctly.

1. Wipe the silver counter electrode with a lint-free paper towel and carefully remove any loose deposits.

2. Screw the cleaning attachment onto the sensor, instead of the membrane head.

**Caution**
Never grease or lubricate the inner O-ring in the RA 600 cleaning attachment!
3 Remove the screw cap from the safety cap of the cleaning attachment.

4 Fill the screw cap with RL-AG/Oxi cleaning solution (see section 5.8 MAINTENANCE EQUIPMENT AND REPLACEMENT PARTS).

5 Screw the sensor with the safety cap onto the screw cap.

6 Leave the cleaning solution to take effect for a maximum of 1 hour.
7 Unscrew the screw cap.

8 Thoroughly rinse the electrode unit with the safety cap on with deionized water.

9 Unscrew the safety cap.
10 Rinse the sensor head and the electrode unit several times with deionized water.

11 Rinse the sensor head and the electrode unit for at least an hour in deionized water.

<td>Recalibrate the sensor (see section 4.2 CALIBRATION).</td>
</tr>
</tbody>
</table>
5.5 Check the sensor for freedom from zero current

The sensor is zero-current free. Therefore, no calibration of the sensor in an oxygen-free solution is included.

However, it is possible to check the freedom from zero-current according to DIN EN 25814/ISO 5814. This is advisable if there is any suspicion of a malfunction.

**Test solution**

1 g/l aqueous sodium sulfite solution, Na₂SO₃ (addition of 1 mg/l of a cobalt(II) salt accelerates the removal of oxygen from the solution.)

The sensor should be in operation for at least 1 hour before the inspection.

**Test procedure**

<table>

<td>2</td>
<td>In the sensor setting table, select the measuring mode % (unit %) and switch to the measured value display with .</td>
</tr>
<tr>
<td>3</td>
<td>Submerse the sensor in the test solution.</td>
</tr>
<tr>
<td>4</td>
<td>Leave the sensor in the test solution for an hour.</td>
</tr>
<tr>
<td>5</td>
<td>Read the measured value.</td>
</tr>
</tbody>
</table>

**Evaluation**

The sensor is OK if the terminal shows < 1 % oxygen saturation.

If the measured value is > 1 %:

- Clean the gold working electrode (see section 5.4.1 CLEANING THE GOLD WORKING ELECTRODE) and change the electrolyte and membrane cap (see section 5.3 CHANGING THE ELECTROLYTE AND MEMBRANE CAP).

- If necessary, also clean the silver counter electrode (see section 5.4.2 CLEANING THE SILVER COUNTER ELECTRODE).
5.6 Storage

Store the clean and dry sensor with its protective cap in place. Observe the allowed temperature range (see chapter 7 TECHNICAL DATA); the sensor may be stored in any position.

5.7 Disposal

We recommend disposing of the sensor without the membrane head as electronic refuse.

Caution

The ELY/A electrolyte solution irritates eyes, skin and mucus membranes. If it comes into contact with the eyes, rinse thoroughly with water and consult a doctor! During working activities, always wear suitable protective gloves and protective goggles/face shield! Follow the safety datasheet.

### Disposal of the membrane cap

<p>| | |</p>

Temperature compensation
IMT (integrated membrane temperature compensation)

Measurement in water
According to solubility function DIN 408 / Part 22

Measurement in salt-contaminated wastewater
Salinity input from 2.0 ... 70.0; corresponds to 3.4 mS/cm ... 86.2 mS/cm at TREF 20 °C (salinity measurement in the range 2 ... 42 according to IOT = International Oceanographic Tables)

Polarization time
In the case of recommissioning or change of electrolyte
At least 60 minutes
In the case of precision measurements
At least 120 minutes and recalibrate on the following day
In the case of short polarization interruptions (depending on the duration of the interruption)
30 to 120 minutes

Temperature measurement
Temperature sensor
integrated NTC

</tr>
</tbody>
</table>

- **Allowed pH range of the test sample**: 4 ... 12

- **Pressure resistance**: Sensor with connected SACIQ sensor connection cable:
  - Max. allowed overpressure: $10^6$ Pa (10 bar)
  - The sensor meets all requirements according to article 3(3) of 97/23/EC ("pressure equipment directive").

- **Type of protection**: Sensor with connected SACIQ sensor connection cable:
  - IP 68, 10 bar ($10^6$ Pa)

- **Immersion depth**: min. 10 cm; max. 100 m depth

- **Operating position**: Predominantly for installation in the D 702/N flow-thru vessel

- **Approach flow**: $\geq 0.3$ m/s (at 1 % measuring accuracy)

- **Flow-thru in the D 702/N**: $\geq 100$ ml/min

- **Field of application**: Oxygen trace sensor, for monitoring boiler feed water for example
7.3 General data

**Dimensions**

- 30.0
- 40.0
- 358

**Weight (without sensor connection cable)**

approx. 660 g

**Connection technique**

Connection via SACIQ sensor connection cable

8 Contact Information

8.1 Ordering & Technical Support

Telephone: (800) 897-4151
(937) 767-7241
Monday through Friday, 8:00 AM to 5:00 PM ET

Fax: (937) 767-1058

Email: environmental@ysi.com

Mail: YSI Incorporated
1725 Brannum Lane
Yellow Springs, OH 45387
USA

Internet: www.ysi.com

When placing an order please have the following information available:

- YSI account number (if available)
- Name and Phone Number
- Model number or brief description
- Billing and shipping address
- Quantity
- Purchase Order or Credit Card

8.2 Service Information

YSI has authorized service centers throughout the United States and Internationally. For the nearest service center information, please visit www.ysi.com and click 'Support' or contact YSI Technical Support directly at 800-897-4151.

When returning a product for service, include the Product Return form with cleaning certification. The form must be completely filled out for an YSI Service Center to accept the instrument for service. The Product Return form may be downloaded at www.ysi.com and clicking on the ‘Support' tab.
9 Indexes

9.1 Explanation of the messages

This chapter contains a list of all the message codes and related message texts that can occur in the log book of the IQ SENSOR NET system for the TriOxmatic® 702 IQ sensor.

**Note**
Information on the contents and structure of the log book, and how to call it up, is given in the LOG BOOK chapter of the IQ SENSOR NET system operating manual.

**Note**
All message codes of the TriOxmatic® 702 IQ end up with “333”.

9.2 Status info

The status info is a coded piece of information on the current status of a sensor. Each sensor sends this status info to the controller. The status info of sensors consists of 32 bits, each of which can have the value 0 or 1.

<table>
<thead>
<tr>
<th>Status info, general structure</th>
</tr>
</thead>
<tbody>
<tr>
<td>0 1 2 3 4 5 6 7 8 9 10 11 12 13 14 15</td>
</tr>
<tr>
<td>1 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 (general)</td>
</tr>
<tr>
<td>0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 (internal)</td>
</tr>
</tbody>
</table>

The bits 0 - 15 are reserved for general information. The bits 16 - 21 are reserved for internal service information.

You obtain the status info:

- via a manual query in the Einstellungen/Service/List of all components menu (see system operating manual)
- by an automated query
  - of a superordinate process control (e.g. when connected to the Profibus)
  - from the IQ Data Server (see IQ SENSOR NET Software Pack operating manual)

**Note**
The evaluation of the status info, e.g. in the case of an automated query, has to be made individually for each bit.

<table>
<thead>
<tr>
