Cleaning and Reconditioning Instructions for the 6561 and 6031 pH, 6032 ORP, and 6565 pH/ORP Probes

Cleaning is required whenever deposits or contaminants appear on the glass and/or platinum surfaces of these probes. Symptoms that signal the need for cleaning/reconditioning include:

- Slow response of pH and/or ORP readings in standards (buffers and Zobell solution)
- Low sensitivity of pH sensor (<160 mV difference between pH 7 buffer and pH 10 buffer)
- Erroneous ORP readings in Zobell solution (outside the range 229 +/- 40 mV at 25° C)

Remove the probe from the sonde. First use clean water and a soft clean cloth, lens cleaning tissue or cotton swab to remove all foreign material from the glass bulb and platinum button or ring. Then use a moistened cotton swab to carefully remove any material that may be blocking the reference electrode junction of the sensor.

CAUTION: When cleaning the platinum button on a 6565 probe with a cotton swab, be certain not to damage glass bulb. Do not force the swab tip between the probe guard and the glass. If the swab is too large to fit between the probe guard and glass, remove material from the swab until unrestricted access to the platinum button is allowed.

If good pH and/or ORP response is not restored by the above procedure, perform the following additional procedure:

1. Soak the probe for 10-15 minutes in clean water containing a few drops of commercial dishwashing liquid.
2. GENTLY clean the glass bulb and platinum button by rubbing with a cotton swab soaked in the cleaning solution.
3. Rinse the probe in clean water, wipe with a cotton swab saturated with clean water, and then re-rinse with clean water.

If good pH and/or ORP response is still not restored by the above procedure, perform the following additional procedure:

1. Soak the probe for 30-60 minutes in one molar (1 M) hydrochloric acid (HCl). This reagent can be purchased from most laboratory supply dealers. Be sure to follow the safety instructions included with the acid.
2. GENTLY clean the glass bulb and platinum button by rubbing with a cotton swab soaked in the acid.

Dry the sonde port and probe connector with compressed air and apply a very thin coat of O-ring lubricant to all O-rings before re-installation.
